Introduction

Project background and context

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against Space X for a rocket launch. The goal of the project is to create a machine learning pipeline to predict if the first stage will land successfully.

Problems you want to find answers

- What factors determine if the rocket will land successfully?
- The interaction amongst various features that determine the success rate of a successful landing.
- What operating conditions need to be in place to ensure a successful landing program?

Methodology

Executive Summary

- Data collection methodology:
 - Data was collected using SpaceX API and web scraping from Wikipedia.
- Perform data wrangling
 - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - How to build, tune, and evaluate classification models

Data Collection

- ► The data was collected using various methods
 - Data collection was done using get request to the SpaceX API.
 - Next, we decoded the response content as a JSON using a .json() function call and turned it into a pandas data frame using .json_normalize().
 - We then cleaned the data, checked for missing values, and filled in missing values where necessary.
 - In addition, we performed web scraping from Wikipedia for Falcon 9 launch records with BeautifulSoup.
 - The objective was to extract the launch records as an HTML table, parse the table and convert it to a pandas dataframe for future analysis.

Data Collection - SpaceX API

- We used the get request to the SpaceX API to collect data, clean the requested data, and do some basic data wrangling and formatting.
- ► The link to the notebook is https://github.com/Bunny2345/D ata_Scince_Capstone/blob/main/Data%20Collection%20API.ip ynb

2. Use json_normalize method to convert json result to dataframe

```
In [12]: # Use json_normalize method to convert the json result into a dataframe
    # decode response content as json
    static_json_df = res.json()

In [13]: # apply json_normalize
    data = pd.json_normalize(static_json_df)
```

3. We then performed data cleaning and filling in the missing values

```
In [30]: rows = data_falcon9['PayloadMass'].values.tolist()[0]

df_rows = pd.DataFrame(rows)
 df_rows = df_rows.replace(np.nan, PayloadMass)

data_falcon9['PayloadMass'][0] = df_rows.values
 data_falcon9
```

Data Collection - Scraping

- We applied web scrapping to Falcon 9 launch records with BeautifulSoup
- We parsed the table and converted it into a pandas data frame.
- The link to the notebook is https://github.com/Bunny2345/Data _Scince_Capstone/blob/main/Data %20Collection%20with%20Web% 20Scraping.ipynb

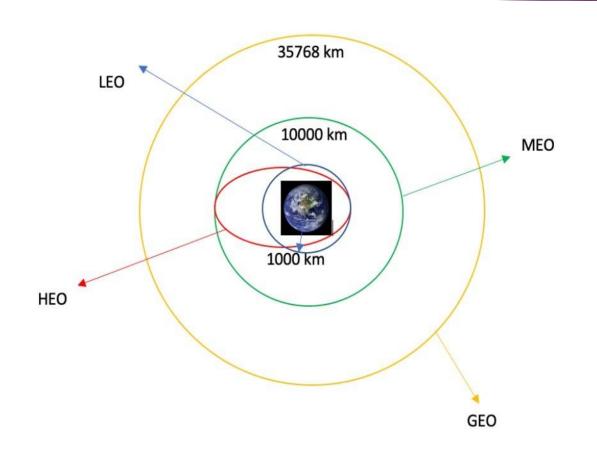

```
1. Apply HTTP Get method to request the Falcon 9 rocket launch page
    static_url = "https://en.wikipedia.org/w/index.php?title=List_of_Falcon_9 and Falcon_Heavy_launches&oldid=1027686922"
      # use requests.get() method with the provided static url
      # assign the response to a object
      html data = requests.get(static url)
      html data.status code
2. Create a BeautifulSoup object from the HTML response
       # Use BeautifulSoup() to create a BeautifulSoup object from a response text content
       soup = BeautifulSoup(html data.text, 'html.parser')
     Print the page title to verify if the BeautifulSoup object was created properly
       # Use soup.title attribute
       soup.title
      <title>List of Falcon 9 and Falcon Heavy launches - Wikipedia</title>
    Extract all column names from the HTML table header
     # Apply find all() function with "th" element on first launch table
     # Iterate each th element and apply the provided extract column from header() to get a column name
     # Append the Non-empty column name ('if name is not None and Len(name) > 0') into a list called column names
     element = soup.find all('th')
      for row in range(len(element)):
             name = extract_column_from_header(element[row])
             if (name is not None and len(name) > 0):
```

4. Create a dataframe by parsing the launch HTML tables

column_names.append(name)

Export data to csv

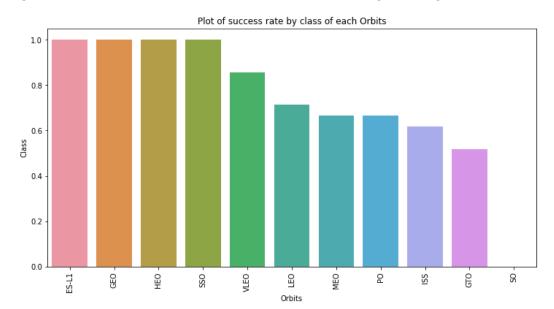

Data Wrangling

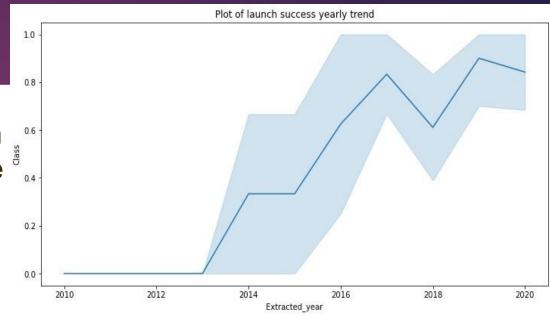

- We performed exploratory data analysis and determined the training labels.
- We calculated the number of launches at each site and the number and occurrence of each orbits
- We created a landing outcome label from the outcome column and exported the results to CSV.
- ► The link to the notebook is https://github.com/Bunny2345/Data_Scince_C apstone/blob/main/Data%20Wrangling.ipynb

EDA with Data Visualization

We explored the data by visualizing the relationship between flight number and launch Site, payload, and launch site, the success rate of each orbit type, flight number and orbit type, and the launch success yearly trend.

 The link to the notebook is https://github.com/Bunny2345/Data_Sci nce_Capstone/blob/main/EDA%20with %20Data%20Visualization.ipynb

EDA with SQL

- We loaded the SpaceX dataset into a PostgreSQL database without leaving the jupyter notebook.
- We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
 - The names of unique launch sites in the space mission.
 - The total payload mass carried by boosters launched by NASA (CRS)
 - The average payload mass carried by booster version F9 v1.1
 - The total number of successful and failed mission outcomes
 - The failed landing outcomes in drone ship, their booster version, and launch site names.
- ► The link to the notebook is https://github.com/Bunny2345/Data_Scince_Capstone/blob/main/EDA%20with%20SQL.ipynb

Build an Interactive Map with Folium

- We marked all launch sites and added map objects such as markers, circles, and lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to classes 0 and 1. i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rates.
- We calculated the distances between a launch site to its proximities. We answered some questions for instance:
 - Are launch sites near railways, highways, and coastlines?
 - Do launch sites keep a certain distance away from cities?

Build a Dashboard with Plotly Dash

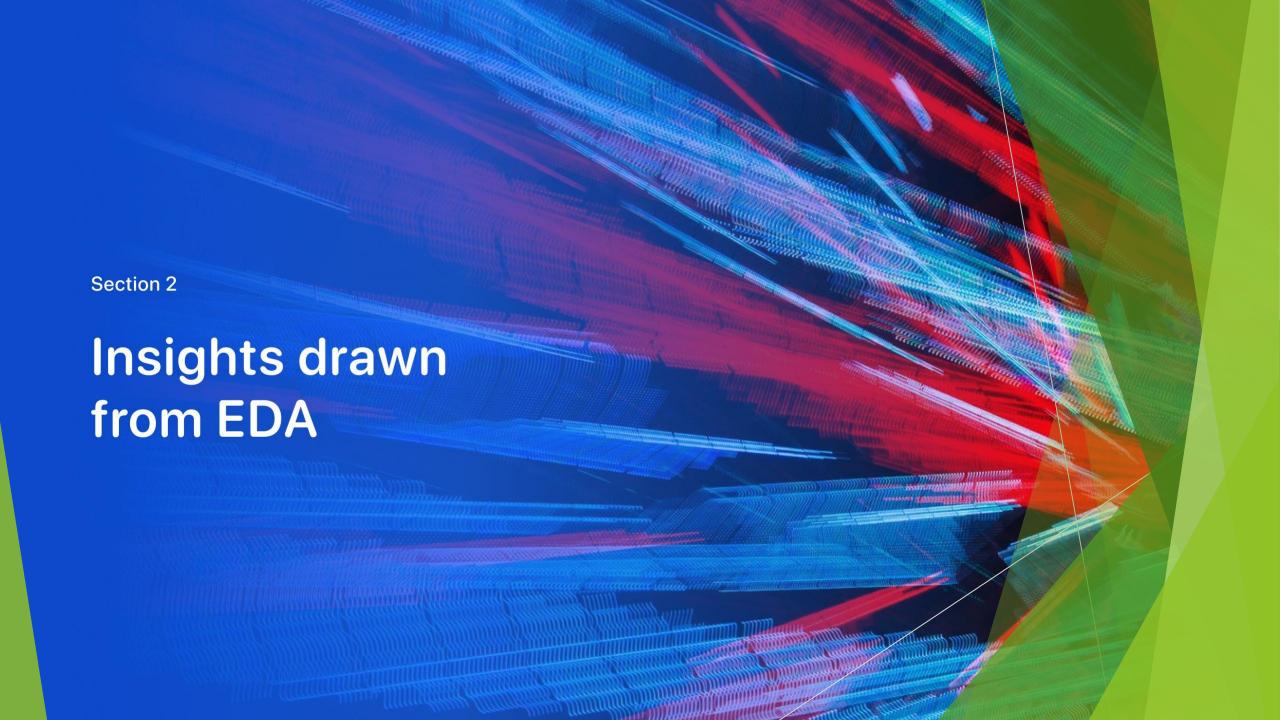

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by certain sites
- We plotted a scatter graph showing the relationship between Outcome and Payload Mass (Kg) for the different booster versions.
- ► The link to the notebook is https://github.com/Bunny2345/Data_Scince_Capstone/blob/main/Extracting %20and%20Visualizing%20Stock%20Data.ipynb

Predictive Analysis (Classification)

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine-learning models and tuned different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model and improved the model using feature engineering and algorithm tuning.
- We found the best-performing classification model.
- ► The link to the notebook is https://github.com/Bunny2345/Data_Scince_Capstone/blob/main/Machine %20Learning%20Prediction.ipynb

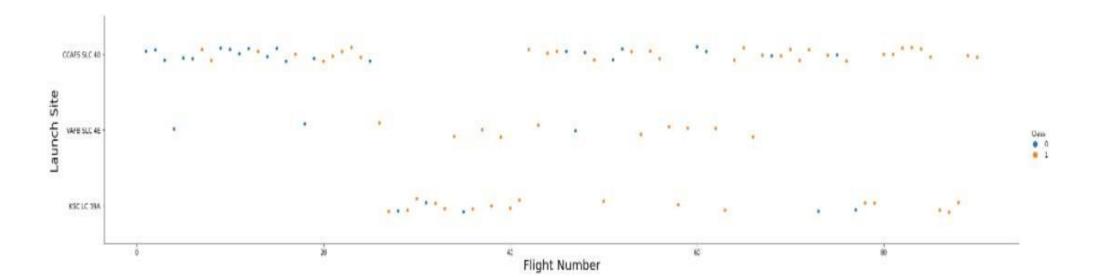

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

Flight Number vs. Launch Site

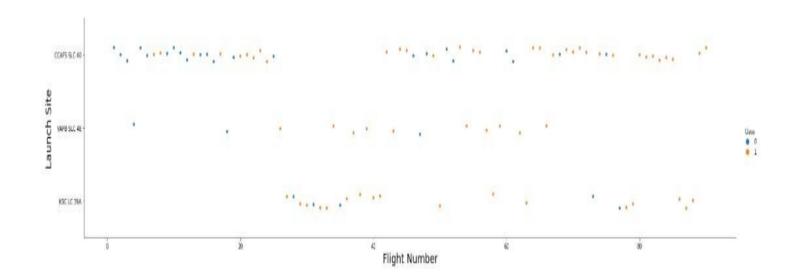

From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

Payload vs. Launch Site

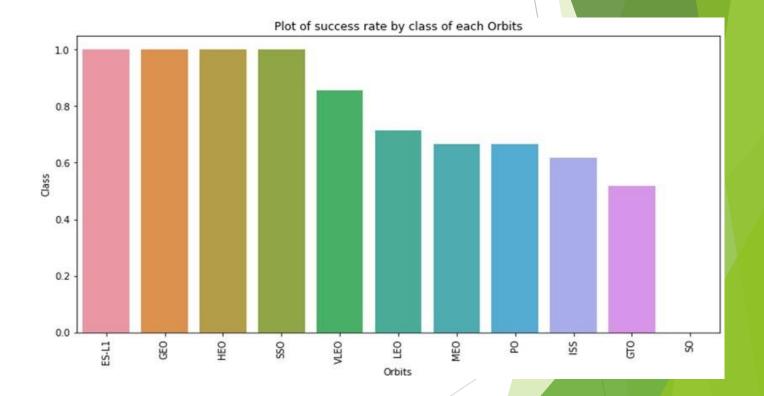

The greater the payload mass for launch site CCAFS SLC 40 the higher the success rate for the rocket.

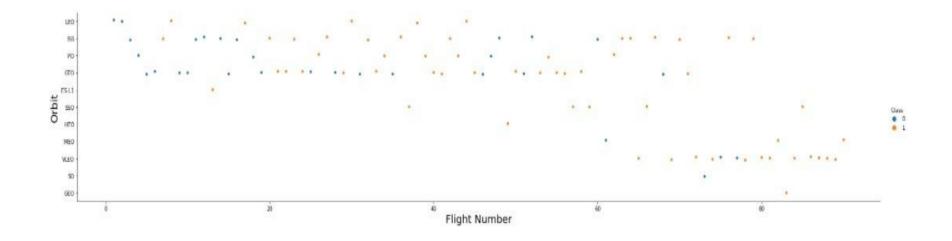

Success Rate vs. Orbit Type

From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

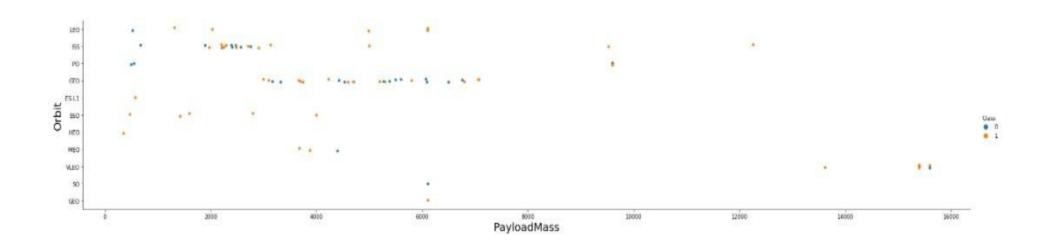

Flight Number vs. Orbit Type

► The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

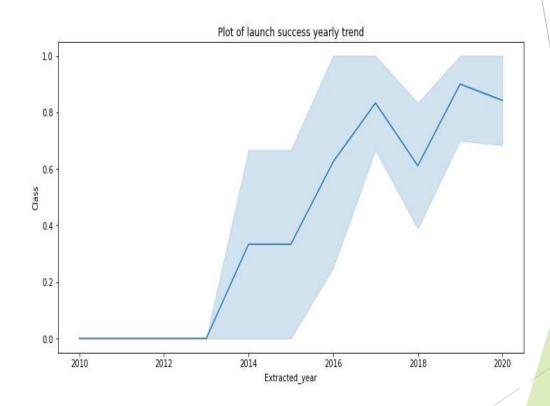

Payload vs. Orbit Type

We can observe that with heavy payloads, the successful landing are more for PO, LEO, and ISS orbits.

Launch Success Yearly Trend

From the plot, we can observe that the success rate since 2013 kept on increasing till 2020.

All Launch Site Names

We used the key word DISTINCT to show only unique launch sites from the SpaceX data.

Display the names of the unique launch sites in the space mission

VAFB SLC-4E

Launch Site Names Begin with 'CCA'

[11]:	ta	FRO WHE	ECT * M SpaceX RE Launc IT 5	t hSite LIKE 'CC	A%"						
	cr	eate_pand	as_df(ta	sk_2, database	=conn)						
[11]:		date	time	boosterversion	launchsite	payload	payloadmasskg	orbit	customer	missionoutcome	landingoutcome
	0	2010-04- 06	18:45:00	F9 v1.0 B0003	CCAFS LC- 40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
	1	2010-08- 12	15:43:00	F9 v1.0 B0004	CCAFS LC- 40	Dragon demo flight C1, two CubeSats, barrel of	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
	2	2012-05- 22	07:44:00	F9 v1.0 B0005	CCAFS LC- 40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attempt
	3	2012-08-	00:35:00	F9 v1.0 B0006	CCAFS LC- 40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attempt
	3	10			40			4.0.00			

We used the query above to display 5 records where launch sites begin with `CCA`

Total Payload Mass

We calculated the total payload carried by boosters from NASA as 45596 using the query below

Display the total payload mass carried by boosters launched by NASA (CRS)

Average Payload Mass by F9 v1.1

We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

Display average payload mass carried by booster version F9 v1.1

First Successful Ground Landing Date

We observed that the date of the first successful landing outcome on the ground pad was 22nd December 2015

Successful Drone Ship Landing with Payload between 4000 and 6000

We used the WHERE clause to filter for boosters that have successfully landed on the drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but less than 6000

Total Number of Successful and Failure Mission Outcomes

We used wildcards like '%' to filter for WHERE MissionOutcome was a success or a failure.

```
In [16]:
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task_7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create pandas df(task 7a, database=conn))
          print('The total number of failed mission outcome is:')
          create_pandas_df(task_7b, database=conn)
         The total number of successful mission outcome is:
            successoutcome
                      100
         The total number of failed mission outcome is:
Out[16]: failureoutcome
```

List the total number of successful and failure mission outcomes

Boosters Carried Maximum Payload

We determined the booster that has carried the maximum payload using a subquery in the WHERE clause and the MAX() function.

```
In [17]:
           task_8 = '''
                    SELECT BoosterVersion, PayloadMassKG
                    FROM SpaceX
                    WHERE PayloadMassKG = (
                                                SELECT MAX(PayloadMassKG)
                                                FROM SpaceX
                    ORDER BY BoosterVersion
            create_pandas_df(task_8, database=conn)
Out[17]:
               boosterversion payloadmasskg
                F9 B5 B1048.4
                                       15600
                 F9 B5 B1048.5
                                       15600
                F9 B5 B1049.4
                                       15600
                F9 B5 B1049.5
                                       15600
                 F9 B5 B1049.7
                                       15600
                F9 B5 B1051.3
                                       15600
                F9 B5 B1051.4
                                       15600
                F9 B5 B1051.6
                                       15600
                F9 B5 B1056.4
                                       15600
                 F9 B5 B1058.3
                                       15600
                F9 B5 B1060.2
                                       15600
                F9 B5 B1060.3
                                       15600
```

List the names of the booster_versions which have carried the maximum payload mass. Use a subquery

2015 Launch Records

We used a combination of the WHERE clause, LIKE, AND, and BETWEEN conditions to filter for failed landing outcomes in drone ships, their booster versions, and launch site names for the year 2015

```
List the failed landing_outcomes in drone ship, their booster versions, and launch site names for in year 2015
```

```
In [18]:
                   SELECT BoosterVersion, LaunchSite, LandingOutcome
                   FROM SpaceX
                   WHERE LandingOutcome LIKE 'Failure (drone ship)'
                       AND Date BETWEEN '2015-01-01' AND '2015-12-31'
                   1.1.1
           create pandas df(task 9, database=conn)
```

Out[18]:		boosterversion	launchsite	landingoutcome	
	0	F9 v1.1 B1012	CCAFS LC-40	Failure (drone ship)	
	1	F9 v1.1 B1015	CCAFS LC-40	Failure (drone ship)	

launchsite landingoutcome

hoosterversion

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

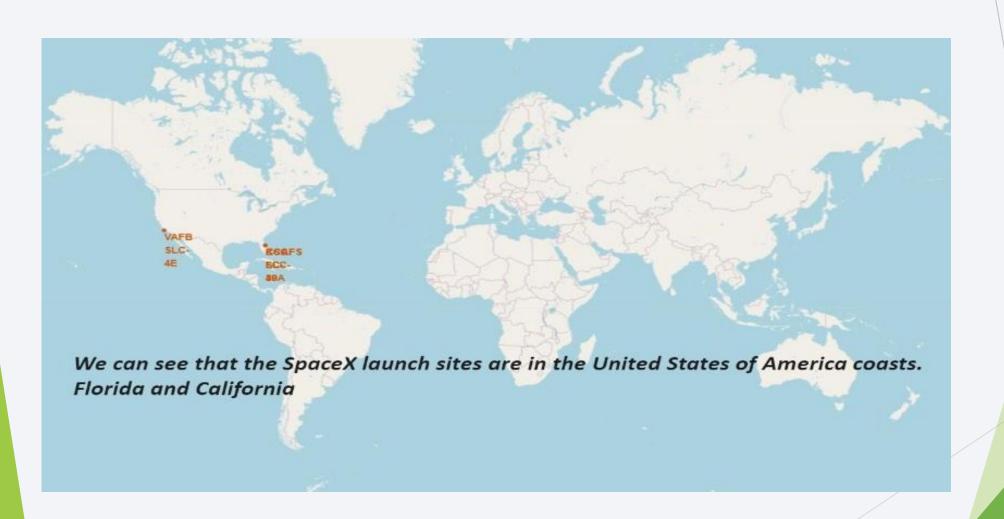

- We selected Landing outcomes and the COUNT of landing outcomes from the data and used the WHERE clause to filter for landing outcomes BETWEEN2010-06-04 to 2010-03-20.
- We applied the GROUP BY clause to group the landing outcomes and the ORDER BY clause to order the grouped landing outcomes in descending order.

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))

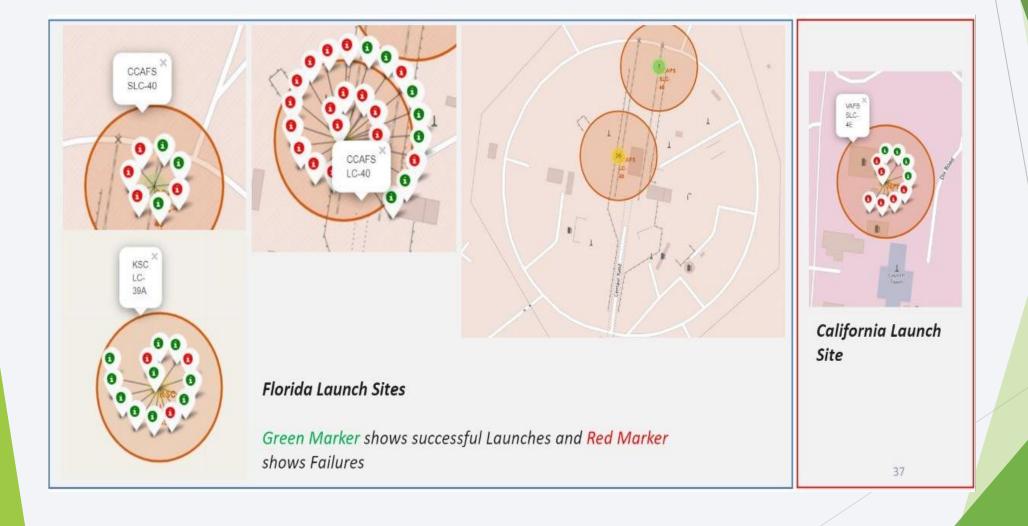

[19]:		landingoutcome	count
	0	No attempt	10
	1	Success (drone ship)	6
	2	Failure (drone ship)	5
	3	Success (ground pad)	5
	4	Controlled (ocean)	3
	5	Uncontrolled (ocean)	2
	6	Precluded (drone ship)	1
	7	Failure (parachute)	1

All launch sites global map markers

Markers showing launch sites with color labels

Launch Site distance to landmarks

Distance to

Coastline

Distance to

Railway Station

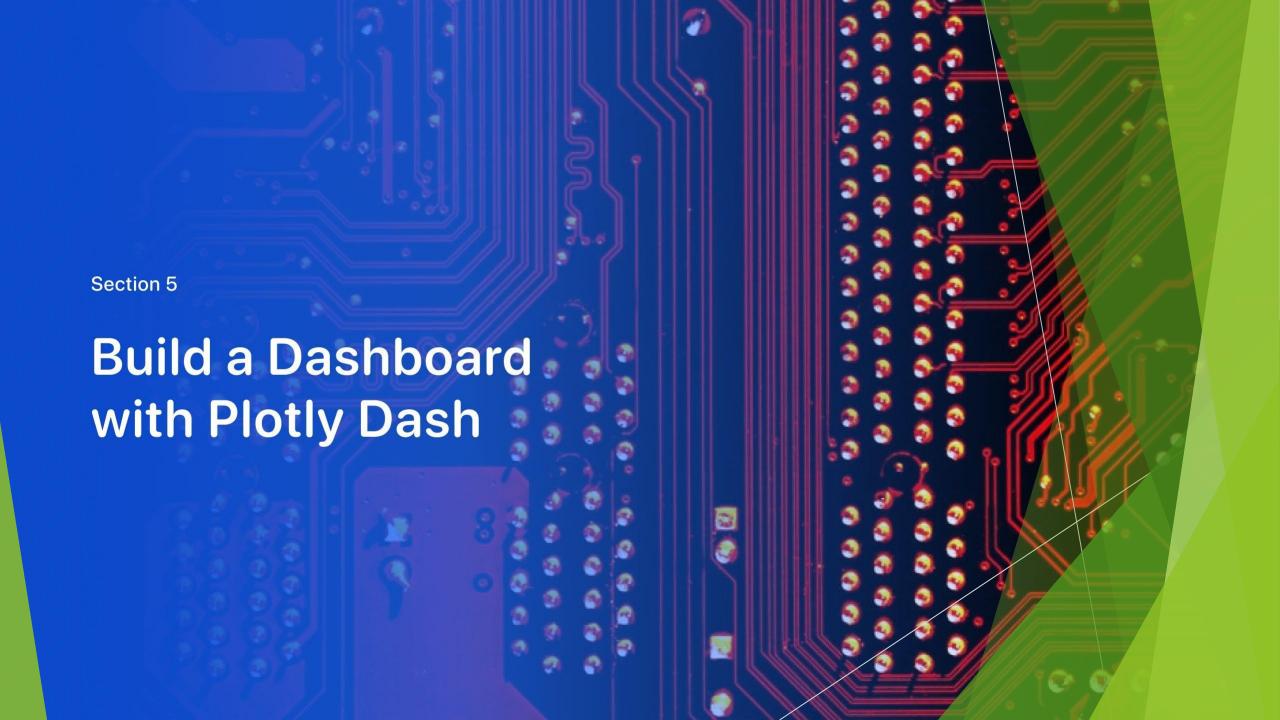

Distance to City

·Are launch sites in close proximity to

*Do launch sites keep certain distance

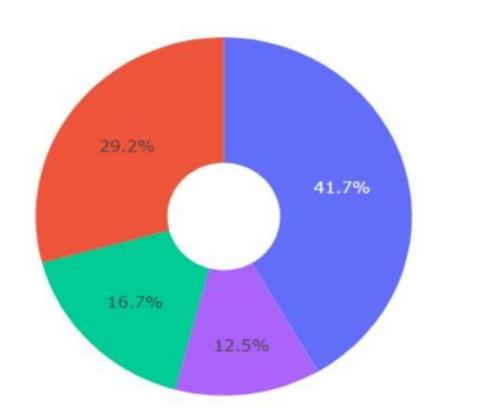

coastline? Yes

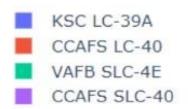

away from cities? Yes

Pie chart showing the success percentage achieved by each launch site

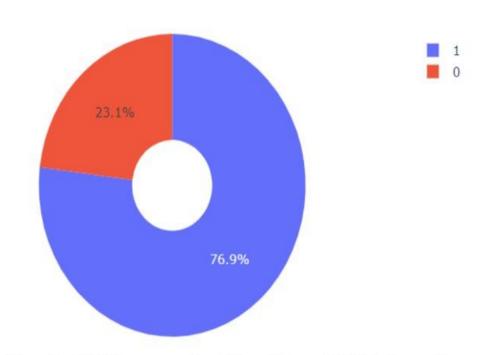

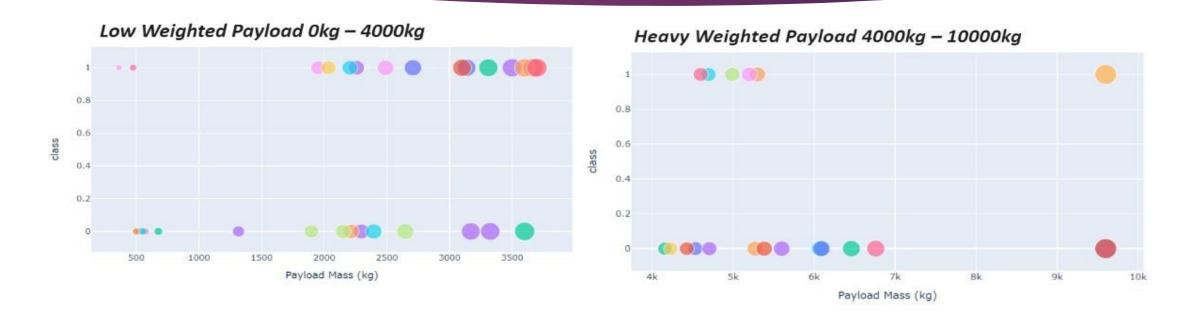

We can see that KSC LC-39A had the most successful launches from all the sites

Pie chart showing the Launch site with the highest launch success ratio

KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

We can see the success rates for low weighted payloads is higher than the heavy weighted payloads

Section 6 **Predictive Analysis** (Classification)

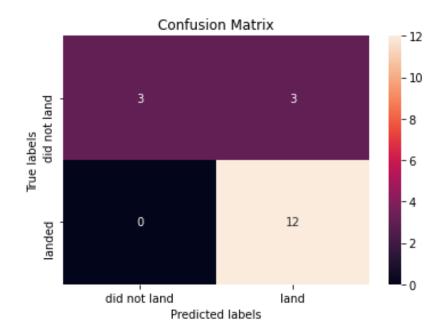

Classification Accuracy

► The decision tree classifier is the model with the highest classification accuracy

```
models = {'KNeighbors':knn cv.best score_,
               'DecisionTree':tree cv.best score ,
               'LogisticRegression':logreg cv.best score ,
               'SupportVector': svm cv.best score }
 bestalgorithm = max(models, key=models.get)
 print('Best model is', bestalgorithm,'with a score of', models[bestalgorithm])
if bestalgorithm == 'DecisionTree':
    print('Best params is :', tree_cv.best_params_)
if bestalgorithm == 'KNeighbors':
    print('Best params is :', knn cv.best params )
if bestalgorithm == 'LogisticRegression':
    print('Best params is :', logreg_cv.best_params_)
 if bestalgorithm == 'SupportVector':
    print('Best params is :', svm cv.best params )
Best model is DecisionTree with a score of 0.8732142857142856
Best params is : {'criterion': 'gini', 'max depth': 6, 'max features': 'auto', 'min samples leaf': 2, 'min samples split': 5, 'splitter': 'random'}
```

Confusion Matrix

The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- ▶ Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, and VLEO had the highest success rate.
- ▶ KSCLC-39A had the most successful launches of any site.
- ▶ The Decision tree classifier is the best machine-learning algorithm for this task.
